

# Nessus Skills Assessment

You have been contracted by the company **InLaneFreight** to perform an internal vulnerability assessment against one of their servers. They have asked for a cursory assessment to be performed to identify any significant vulnerabilities as they do not have the budget for a full-scale penetration test this year. The results of this vulnerability assessment may enable the CISO to push for additional funding from the Board of Directors to perform more in-depth security testing.

The target server is a Windows Server host used as a development server.

## Requirements

Navigate to the web interface at the end of this section and log in with the provided credentials.

Once logged in, perform a **BASIC NETWORK SCAN** (modify the scan template to scan **ALL** ports, leave all other options the same) against the target: **172.16.16.100**. Additionally, set up the scan to be authenticated using **administrator:Academy\_VA\_adm1!** as the credentials.

The scan will take up to 60 minutes to finish.

*Note: It may take 1-2 minutes for your target instance to spawn. Additionally, it may take up to an hour for the scan to run*

Alternatively, use the pre-populated scan data to answer the questions below without having to wait for the scan to finish but feel free to practice configuring and running it.

### VPN Servers

**Warning:** Each time you "Switch", your connection keys are regenerated and you must re-download your VPN connection file.

All VM instances associated with the old VPN Server will be terminated when switching to a new VPN server.

Existing PwnBox instances will automatically switch to the new VPN server.
