

Parameter Fuzzing - POST

The main difference between **POST** requests and **GET** requests is that **POST** requests are not passed with the URL and cannot simply be appended after a **?** symbol. **POST** requests are passed in the **data** field within the HTTP request. Check out the [Web Requests](#) module to learn more about HTTP requests.

To fuzz the **data** field with **ffuf**, we can use the **-d** flag, as we saw previously in the output of **ffuf -h**. We also have to add **-X POST** to send **POST** requests.

Tip: In PHP, "POST" data "content-type" can only accept "application/x-www-form-urlencoded". So, we can set that in "ffuf" with "-H 'Content-Type: application/x-www-form-urlencoded'".

So, let us repeat what we did earlier, but place our **FUZZ** keyword after the **-d** flag:

```

Parameter Fuzzing - POST

dbcypn@htb[/htb]$ ffuf -w /opt/useful/SecLists/Discovery/Web-Content/burp-parameter-names.txt:FUZZ -u http://
v1.1.0-git

-----

:: Method      : POST
:: URL         : http://admin.academy.htb:PORT/admin/admin.php
:: Wordlist     : FUZZ: /opt/useful/SecLists/Discovery/Web-Content/burp-parameter-names.txt
:: Header      : Content-Type: application/x-www-form-urlencoded
:: Data        : FUZZ=key
:: Follow redirects : false
:: Calibration  : false
:: Timeout     : 10
:: Threads     : 40
:: Matcher     : Response status: 200,204,301,302,307,401,403
:: Filter      : Response size: xxx

-----

id [Status: xxx, Size: xxx, Words: xxx, Lines: xxx]
<...SNIP...>

```

As we can see this time, we got a couple of hits, the same one we got when fuzzing **GET** and another parameter, which is **id**. Let's see what we get if we send a **POST** request with the **id** parameter. We can do that with **curl**, as follows:

```

Parameter Fuzzing - POST

dbcypn@htb[/htb]$ curl http://admin.academy.htb:PORT/admin/admin.php -X POST -d 'id=key' -H 'Content-Type: a
<div class='center'><p>Invalid id!</p></div>
<...SNIP...>

```

As we can see, the message now says **Invalid id!**.
